

Project 02: CSS & Visual Presentation

Evaluation Sheet — Styling, Layouts & The Box Model

Student: _____ Evaluator: _____ Date: _____

Section 1: Flexbox Layout Mechanics

Navigation bar and card grid are styled using display: flex. Main axis alignment (justify-content) and cross axis alignment (align-items) are used correctly. Cards wrap gracefully with gap spacing.

Check: "What happens to the main axis if flex-direction is changed to column?"

[YES]

[NO]

Section 2: CSS Positioning Contexts

Fixed navbar and back-to-top button stay pinned during scrolling. The card has position: relative and the absolute badge anchors cleanly inside the card's top-right corner.

Check: "What happens to an absolute element if no parent has position: relative?"

[YES]

[NO]

Section 3: The CSS Box Model

Demonstrates the difference between content-box and border-box. The universal reset (*, *::before, *::after) is implemented with box-sizing: border-box. Spacing (padding, border, margin) is intentional.

Check: "Why does box-sizing: border-box make responsive layouts much easier to manage?"

[YES]

[NO]

Section 4: Colors, Opacity & CSS Shapes

Colors are applied using Named, HEX, RGB, and RGBA formats. Demonstrates why opacity fades child elements while background-color: rgba() affects only the background. Draws shapes (circle, square, triangle) with pure CSS.

Check: "Explain the difference between opacity: 0.5 and background-color: rgba(0,0,0,0.5)."

[YES]

[NO]

Section 5: Bonus: Animations & Transitions [BONUS]

Smooth infinite @keyframes loader animation and interactive :hover micro-interactions on cards and buttons with transform and transition.

Check: "Why do transitions require both a starting state and an ending state?"

[YES]

[NO]

Summary & Final Result:

All 4 mandatory sections must be YES to PASS.

RESULT:

[] PASS [] FAIL
